    ö
activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include nutritional activity, cytokine and cell cartioud-differentiation activity, immune stimulating (e.g. soliferation/differentiation activity, immune stimulating (e.g. activity, tissue growth activity, haematopoiesis regulating activity, activin/inhibin activity, chemotactic/chemokinetic activity, activin/inhibin activity, cativity, receptor/ligand activity, anti-inflammatory activity, activity, activity, and tumour inhibition activity. The polynucleotides are also stated to be useful for gene therapy. The sequences identified by a secretory leader cativity activity by virtue of their secreted nature. This polypeptide was encoded by a clone designated AS209_1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NGLANLNTLELFONRLTIPNGAFVYLSKLKELWLRNNPIESIPSYAFNRIPSLRRLDLG 180

AAY13344-403 represent secreted and transmembrane human proteins.

The cDNA sequences are obtained from CDNA libraries, prepared from fetal lung, fetal thiorey, fetal brain, fetal liver and fetal retina.

The ancoded polypeptides have specific uses based on their homology to speciated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions

(e.g. enterocolitis, 20llinger-Ellison syndrome, gastrointestinal mucosa and the repair of acute and chronic mucosal lesions

(e.g. enterocolitis, 20llinger-Ellison syndrome, gastrointestinal microvallus atrophy, skind diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis, epithelial cancers such as lung squamous cell carcinoma of the vulva and gliomas), concers such as lung squamous cell carcinoma of the vulva and gliomas), concers such as lung squamous cell acarcinoma of the vulva and gliomas), content effects on cell growth and development, diseases related to growth or survival of nerve cells including Parkinson's disease, as a target for anti-tumor drugs. PRO533 may be used in the treatment of usher Syndrome or Arrophia areata; PRO565 can be used as an anti-thrombotic agent; PRO387 polypeptides and portions may have threatpeutic applications in wound healing and tissue sepair. PRO317 can be used for treating problems of the kidney, uterus, endometrium, blood vessels, or related tissue, e.g. in the heart of genital tract.
                                                                                                                                                New isolated human genes and polypeptides used in, e.g. treatment of gastrointestinal ulceration

         nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endotherial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB2435 represent nucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                        NGLANLNTLELFDNRITTIPNGAFVYLSKLKELWLRNNPIESIPSYAFNRIPSLRRLDLG 180

                                                                                                                                                                                                                                                The present sequence is the human protein PRO331, encoded by UN0292 cDNA, designated as clone DNA40981. It is isolated from human foetal brain tissue. Portions of PRO331 has homology to the LiG-1 protein.

It enhances or suppresses the infiltration of Inflammatory cells into tissues, proliferation of I-lymphocytes and modulates the immune related alsorders, like SLE, rheumatoid/juvenile arthritis, spondyloarthropathy, systemic sclerosis (scleroderma), idiopathic inflammatory myopathies such systemic sclerosis (scleroderma), idiopathic inflammatory myopathies such as dermatompositis, Slogren's syndrome, vasculitis, sarcoidosis, autoimmune heemolytic anaemia, thrombocytopenia, thyroiditis e.g. Grave's disease, diabetes mellitus, immune-mediated renal disease e.g. cultilain-Barre syndrome, hepatobiliary diseases like hepatitis and cullian-Barre syndrome, hepatobiliary diseases like hepatitis and primary biliary cirrhosis, inflammatory and fibrotic lung diseases such as inflammatory bowel disease (e.g. Crohn's disease), autoimmune or immune-mediated skin diseases such as psoriasis, allergies like asthmà, immunological diseases of the lungs such as posinophilic pneumonia and transplantation associated diseases such as graft-versus-host-disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                          Composition for treatment and diagnosis of immune related diseases e.g. Grave's disease comprises a PRO245, PRO217, PRO301, PRO266, PRO335, PRO331 or PRO326 polypeptide or its agonists or antagonists (preferably

ANU12172-AAU12446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bloactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing PRO polypeptides, to modulate biological activities of cells expressing pro propagate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor alpha (TNP-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation of chondrocytes, the proliferation of inner ear utricular supporting cells or artilage, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the release of a cytokine from peripheral blood monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor VIIA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, transgenic or knock out animals and can be used in gene therapy. Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g. Claim 12; Fig 368; 813pp; English breast, prostate, cervical lung,

The sequence represents Human PR0331 (UN0292), a protein involved in the immune response. PRO polypeptides, and (ant)agonists to them, are used in compositions of medulating in inflammatory cells into a tissue, modulating an immune response and modulating proliferation of T-lymphocytes in response to an antigen. Immune related diseases can be treated with the compositions, such as, systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthopathies, systemic sclerosis, idiopathic inflammatory compositions, such as moment enempty of autoimmune thrombocytopaenic sclerosis, idiopathic inflammatory autoimmune mediated renal disease, Hashimoto's thyroiditis), autoimmune-mediated renal disease, (e.g. immune pancytopaenic purpura), autoimmune-mediated renal disease, (e.g. immune pancytopaenic purpura), cartoiditis (e.g. Grave's disease, Hashimoto's thyroiditis), diabetes mellitus, immune-mediated renal disease, e.g. immune pancytopaenic purpura), campyelinating diseases of the central and peripheral nervous systems e.g. multiple sclerosis or Guillain-Barre syndrome, and chronic inflammatory cartoidentes and polyneurorpathy, hepatolilary diseases such as infectious cauto immune chronic active hepatitis, primary biliary cirrhosis, disease (ulcerative colitis, Crohr's diseases and Whipple's disease), autoimmune or immune-mediated skin diseases (e.g. erythaemia colitis, crohr's diseases and whipple's disease, food hypersensitivity, immunologic diseases and whipple scolated diseases including graft-versus-host-disease and graft colonophilic pneumonias, idopathic pulmonary fibrosis, transplantation associated diseases including graft-versus-host-disease and graft colonophilic pneumonias, idopathic pulmonary fibrosis, ransplantation of the diseases, to identify publibitors, and to stimulate the proliferation of indiagnosis. PNC polypeptides can be used to detect PRO onlypeptides and the publicates and entiped publication and publicated publication and publication and publicati

                                                                                                                                                                                                                                                                                                                                                                                                                                                       transmembrane PRO polypeptides. The PRO polypeptides are useful for treating skin diseases (e.g. psoriasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. lung enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthmatoria cardiolastes and retinal disorders such as retinitis pigmentosum. The PRO nucleic acids have applications in molecular biology, including use as hybridization probes, and in chromosome and gene mapping.
                                                                                                                                                                                                                                                                                                                                             in

                                                                                                                                                                                                                       proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as can be used for targeted delivery of bioactive molecules, such as can be used as radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. Ash44270 to AR44470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAR44087 to AAR44269 and AAB65180 tepresent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B5309), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion process comprising a PRO protein, agonists or antagonists of a PRO protein and compounds which inhibit the expression of a PRO gene. The invention

```
augiculationally encompasses mechanism in a monthelial or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid, or PRO agonist or antagonist; a retroviral gene therapy vector comprising a PRO agonist or antagonist; a retroviral gene therapy vector comprising a PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof. PRO nucleic acids, PRO protein, or an agonist or antagonist thereof. PRO nucleic acids, PRO protein, or an agonist or antagonist thereof. PRO agonists and PRO antagonists may be used as therapeutic agents to treat cardiovascular, endothelial or angiogenic disorders, such as therosclerosis, osteoporosis, myocardial infarction, hypertension, diabettic retinopathy, rheumatoid arthritis, Crohn's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, Huntington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to soreen libraries to isolate cDMAs with sequence identity to PRO proteins, comang genes encoding PRO proteins, a maling gene therapy. PRO nucleic acids can also be used to produce transgenic and an also also and an angle of produce transgenic can also also and also proteins.

polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors. TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadheains, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially

by recombinant techniques.

ANUL2172-AAU12446 represent novel human secretory and transmembrane.

PRO polypeptides. The PRO polypeptides are useful to detect other

PRO polypeptides, to link bioactive molecules to cells expressing

PRO polypeptides, to modulate biological activities of cells expressing

PRO polypeptides, and to detect the presence of mammalian lung, colon,

breast, prostate, rectal, cervical or liver tumours by comparing PRO

Dolypeptide expression in a cell sample to that in a control sample.

Some of the 275 sequences are also useful to stimulate the release of

tumour necrosis factor-alpha (TNF-alpha) from human blood, the

proliferation or differentiation of chondrocytes, the proliferation or

gene expression in perioyte cells, the release of proteoglycans from

cartilage, the proliferation of inner ear utricular supporting cells or

of T-lymphocytes, the release of a cytckine from peripheral blood

monocytes (PBMCs), or the proliferation of endothellal cells. Some of

the PRO polypeptides may modulate glucose or free fatty acid uptake by

skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide

cof actor VIIA. The PRO polypeptides can be used in assays to identify

molecules involved in binding interactions. The polymuclecides encoding

PRO polypeptides can be used to generate probes, antisense RNA/NNA,

transgenic or knock out animals and can be used in gene therapy. 3 Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g. lung, breast, prostate, cervical Gao Deforge L, Desnoyers L, Filvaroff E, Ga A, Godowski PJ, Gurney AL, Sherwood S; Tumas D, Watanabe CK, Wood WI, Zhang 2?. Claim 12; Fig 438; 813pp; English

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

chondroadherin precursor - bovine
N;Alternate names: 38K leucine-rich protein
C;Species: Bos primigenius taurus (cattle)
C;Date: (07-Oct-1994 #sequence_revision 07-Oct-1994 #text_change 05-Nov-1999
C;Accession: A53860
R;Neame, P.J.; Sommarin, Y.; Boynton, R.E.; Heinegard, D.
J Blol. Chem. 269, 21547-21554, 1994
A;Title: The structure of a 38-KDa leucine-rich protein (chondroadherin) isolated fro A;Reference number: A53860; MUID:94342341
                                                                                                                                                                                                                                                                                                                                                                                                        A; Status: preliminary

The protein 1 precursor - fruit fly (Drosophila melanogaster)

C;Species: Drosophila melanogaster
C;Date: 30-Apr-1991 #sequence_revision 30-Apr-1991 #text_change 17-Nov-2000
C;Accession: A36665; A31640; S13523
R;Rothberg, J.M.; Jacobs, J.R.; Goodman, C.S.; Artavanis-Tsakonas, S.
Genes Dev. 4, 2169-2187, 1999
A;Title: slit: an extracellular protein necessary for development of midline glia and A;Reference number: A36665; MUID:91099665
A;Status: preliminary
A;Molecule type: mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                <LR11>

-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).

-!- TISSUE SPECIFICITY: OVERAMPLIFIED IN MALICANNY GLIOMAS.

-!- SIMILARITY: BELONGS TO THE IMMUNOGLOBULIN SUPERFAMILY.

-!- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.

-!- SIMILARITY: CONTAINS 11 LEUCINE-RICH REPEATS (LRR).

THE ADHESION OF PLATELETS TO INJURED VASCULAR SURFACES IN THE ARTERIAL CIRCULATION IS A CRITICAL INITIATING EVENT IN HEMOSTASIS (BY SIMILARITY).
SUBCELLULAR LOCATION: Type I membrane protein.
SIMILARITY: CONTAINS 14 LEUGINE-RICH REPEATS (LRR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   InterPro; IPR003592; LRR_out.

1nsulin-like growth factor binding protein complex acid labile chain
IGFALS OR ALS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Delhanty P., Baxter R.C.,
The cloning and expression of the baboon acid-labile subunit of the insulin-like growth factor binding protein complex.";
Blochem. Blophys. Res. Commun. 227:897-902(1996).
I- FUNCTION: INVOLVED IN PROTEIN-PROTEIN INTERACTIONS THAT RESULT IN PROTEIN COMPLEXES, RECEPTON-LIGAND BINDING OR CELL ADHESION.
I- SUBBUNIT: FORMA A TERMARY COMPLEX OF ABOUT 140 TO 150 kDa WITH IGF-ID A IGF-II AND IGFBP-3 (BY SIMILARITY).
I- SUBCELLULAR LOCATION: Extracellular.
I- SIMILARITY: CONTAINS 20 LEUGINE RICH REPEATS (LRR).

-!- FUNCTION: INVOIVED IN PROPEIN-PROTEIN INTERACTIONS THAT RESULT
-!- FUNCTION: INVOIVED IN PROPEIN-PROTEIN INTERACTIONS THAT RESULT
IN PROTEIN COMPLEXES, RECEPTOR-LIGAND BINDING OR CELL ADHESION.
-!- SUBGINIT: FORMS A TERNARY COMPLEX OF ABOUT 140 TO 150 kDa WITH
IGF-I OR IGF-II AND IGFBP-3.
-!- SUBGELLULAR LOCATION: Extracellular.
-!- SINGELLULAR: CONTAINS 20 LEUCINE-RICH REPEATS (LRR).
